

An Element tale: My Journey to Krypton (Kr)

I decided that the best thing to make my spaceship out of was uranium (U).

It's a very strontium (Sr) material and very technetium (Tc) advanced.

I debarked on my nobelium (No) mission to krypton (Kr).

Hafnium (Hf) the way there, I realized I was too close to Argon (Ar).

They sent their tin (Sn) fighters after me.

Using my thorium (Th) ray, that Einsteinium (Es) designed, I sent them to a very bohrium (Bh) place, the underworld.

I was curium (Cm) about the radium (Ra) planet Xenon (Xe).

When I looked at it, it looked exactly like my home Germanium (Ge).

When I got to krypton (Kr) it was really boron (B).

At least I'm not lead (Pb).
